Notes:

1. The receiver shall be able to tolerate, without damage, continuous exposure to an optical input signal having this average power level on one lane. The receiver does not have to operate correctly at this input power.
2. Average receive power, each lane (minimum), is informative and not the principal indicator of signal strength.
3. Receiver sensitivity is informative and is defined for a transmitter with a value of SECQ up to 4.5dB.
4. Measured with conformance test signal at TP3 (see 138.8.10) for the BER specified in 138.1.1.
5. Ceq is a coefficient defined in 121.8.5.3, which accounts for the reference equalizer noise enhancement.
6. These test conditions are for measuring stressed receiver sensitivity. They are not characteristics of the receiver.

Notes:

1. QSFP-DD uses common ground (GND) for all signals and supply power. All are common within the QSFP-DD module, and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal common ground plane.

2. VccRx, VccRx1, Vcc1, Vcc2, VccTx, and VccTx1 shall be applied concurrently. Requirements defined for the host side of the Host Card Edge Connector are listed in the Optical Characteristics. VccRx, VccRx1, Vcc1, Vcc2, VccTx, and VccTx1 may be internally connected within the module in any combination. The connector Vcc pins are each rated for a maximum current of 1000mA.
3. All Vendor-Specific, Reserved, and Not Connected pins may be terminated with 50Ω to ground on the host. Pad 65 (Not Connected) shall be left unconnected within the module. Vendor-Specific and Reserved pads shall have an impedance to GND that is greater than 10kΩ and less than 100pF.
4. Plug Sequence specifies the mating sequence of the host connector and module. The sequence is 1A, 2A, 3A, 1B, 2B, and 3B. Contact sequence A will make, then break contact with additional QSFP-DD pads. Sequence 1A, 1B will then occur simultaneously, followed by 2A, 2B, followed by 3A, 3B.
